

Figure 1

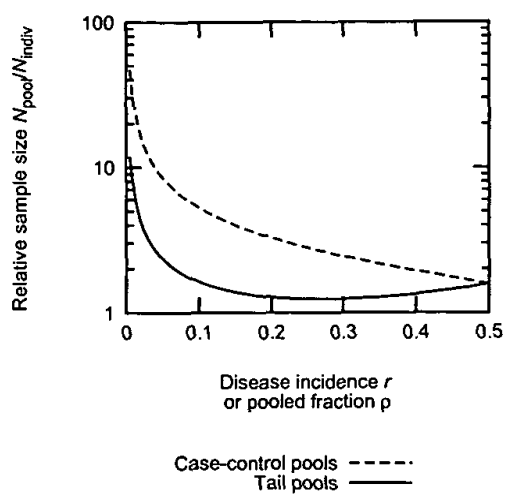

Figure 1 is a log-log plot showing the frequency difference at significance (Y-axis, ranging from 0.01 to 1.00) versus the relative risk (X-axis, ranging from 0.001 to infinity). Two curves are plotted: Case-control pools (dashed line) and Tail pools (solid line). The Case-control pools curve is consistently higher than the Tail pools curve, indicating a larger frequency difference at significance for the same relative risk. The curves intersect at a relative risk of approximately 0.1.
